Ex. No. 10	ADD ANDROID AS A BUILD TARGET
Date of Exercise	
Git Hub Host Link	https://github.com/gurubruhh/Flutter-Laboratory.git

Aim

To configure and build a Flutter application for Android.

Description

This experiment focuses on developing and executing a Flutter application on Android devices. It covers Flutter environment setup, device detection and project creation. The application is tested on an Android emulator or physical device. Finally, an APK file is generated for installation.

Procedure:

1. Check Flutter installation using flutter doctor.
2. Check connected Android devices using flutter devices.
3. Accept Android licenses using flutter doctor --android-licenses.
4. Create a project using flutter create android_app.
5. Open the project in VS Code.
6. Design the application interface using Flutter widgets.
7. Connect an Android emulator or physical device.
8. Run the application using flutter run.
9. Test the application UI, buttons and functionality.
10. Generate the APK using flutter build apk.

Program

```
import 'package:flutter/material.dart';

void main() {
  runApp(const MyApp());
}

class MyApp extends StatelessWidget {
  const MyApp({super.key});

  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      debugShowCheckedModeBanner: false,
```

```
title: 'Android App',
theme: ThemeData(
      primarySwatch: Colors.blue,
    ),
    home: const HomeScreen(),
  );
 }
}

class HomeScreen extends StatelessWidget {
 const HomeScreen({super.key});

 @override
 Widget build(BuildContext context) {
  return Scaffold(
    appBar: AppBar(
      title: const Text('Android Application'),
      backgroundColor: Colors.blue,
      foregroundColor: Colors.white,
    ),

    body: Center(
      child: Column(
        mainAxisAlignment: MainAxisAlignment.center,
        children: [
          const Icon(
            Icons.android,
            size: 100,
            color: Colors.green,
          ),

          const SizedBox(height: 20),

          const Text(
            'Welcome to Flutter!',
            style: TextStyle(
              fontSize: 24,
              fontWeight: FontWeight.bold,
            ),
          ),

          const SizedBox(height: 10),

          const Text(
            'Your Android application is running successfully.',
            textAlign: TextAlign.center,
            style: TextStyle(fontSize: 16),
          ),

          const SizedBox(height: 25),
```

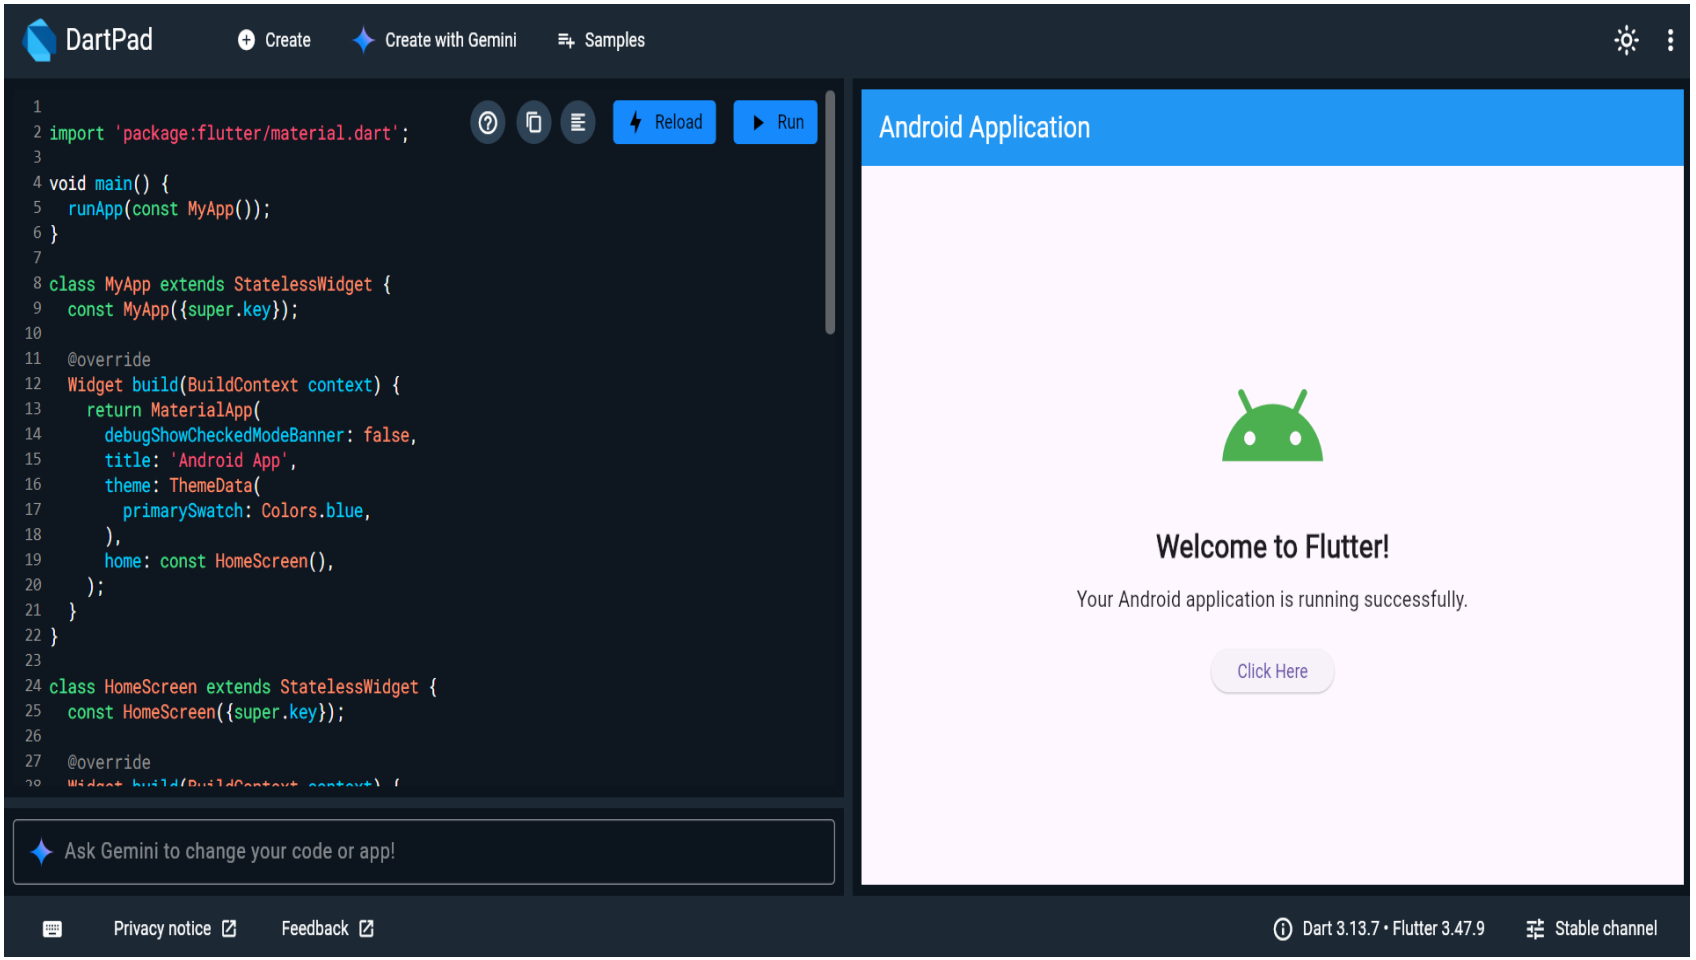

```
ElevatedButton(

            onPressed: () {
              ScaffoldMessenger.of(context).showSnackBar(
                const SnackBar(
                  content: Text('Button clicked successfully!'),
                ),
              );
            },
            child: const Text('Click Here'),
          ),
        ],
      ),
    ),
  );
 }
}
```

24CS2016 Building Applications using Flutter

Output

Result

Thus, the Flutter application was successfully developed to load and display image and video assets. The video was successfully controlled using Play and Pause buttons.
